

■ April 2026 · Product Overview

Recall X247

Your AI second brain — capture once, recall anywhere, act on what matters.

V2 · LIGHT

FOR FOUNDERS, RESEARCHERS & OPERATORS

Knowledge work is leaking out of your week.

You read, watch, and learn constantly — but the insights never make it into Monday morning. Notes go cold. Tabs close. Tools fragment. Nothing closes the loop from input to action.

OVERLOAD

Too many sources

YouTube, articles, PDFs, voice memos, Slack — knowledge piles up in twelve different inboxes.

LOSS

Notes go cold

You highlight, you screenshot, you forget. Two weeks later the insight is gone and the link is dead.

NO EXECUTION

Learning ≠ doing

You finish a great talk and write nothing down. No task gets created. The idea evaporates.

FORGETTING

No retrieval

You know you saved it — somewhere. Search by keyword fails. Your past self is unreachable.

NO FOCUS

Mornings start cold

No daily brief, no priorities, no “here’s what changed overnight.” You re-orient from scratch.

FRAGMENTATION

Six tabs, one brain

Notion, Apple Notes, Readwise, Calendar, Tasks — none of them know about each other.

One loop. From any input, to a daily action.

Recall X247 turns scattered inputs into a queryable knowledge vault and a daily plan. Capture anything, recall it semantically, act on what matters today, review tomorrow.

Built for the three people who can't afford to forget.

F

Founders

MOVE FAST, NEVER LOSE CONTEXT

Capture investor calls, podcasts and product ideas in seconds. Recall them word-for-word in pitch prep.

Lives in: Capture · Briefing · Agent Hub

R

Researchers

SYNTHESIZE, CITE, RETAIN

Index papers, lectures and PDFs into a personal corpus. Ask follow-up questions and get cited answers.

Lives in: Recall · Graph · Flashcards

O

Operators

RUN THE DAY ON RAILS

Turn meeting notes and voice memos into prioritized tasks, calendar slots and a focused morning briefing.

Lives in: Tasks · Calendar · Inbox

What a brand new user actually does on day one.

1

Sign up

Email or Google. No setup wizard.

2

Land on Dashboard

Empty-state hints point to Capture.

3

Capture first item

Paste a YouTube link or a PDF.

4

Ask the Agent

"Summarize what I just saved."

5

Get a Briefing

Morning email + in-app card.

6

Review Inbox

Confirm or skip the day's queue.

The first capture lights up the whole product: a memory becomes searchable, generates flashcards on demand, and shows up in tomorrow's briefing — **no configuration required.**

Knowledge Capture — anything in, structured out.

- **Five input types:** YouTube, web articles, PDFs, plain notes, and voice memos.
- **Specialist extractors** per source — transcripts for video, readability for the web, OCR for PDFs.
- **Auto-summary, key points and tags** generated on save, no second click.
- **Source preserved verbatim** so every later answer can cite the original passage.
- **Voice mode** with live transcription and a clean “Checking Live availability” status.

note

Neural Recall – three-tier semantic search with cited sources.

- **Tier 1 — Vector search** over titles, summaries and chunks for instant matches.
- **Tier 2 — Cross-encoder rerank** promotes the passages that actually answer the question.
- **Tier 3 — Agent synthesis** stitches a cited answer from the top passages.
- **Every claim links back** to the source memory, with the exact quote highlighted.
- **No web fallback by default** — answers come from your vault, not the open internet.

● Sample query

“What did Lex Fridman say about long-term memory in transformers?”

Tasks & Projects – every action traces back to a memory.

- **Priority & due dates** with smart sorting: today, this week, blocked, snoozed.
- **Linked to source memories** — open the task, see the article that spawned it.
- **Project grouping** for multi-step work so themes don't get lost in a flat list.
- **Created from anywhere**: chat with the Agent, the briefing card, or directly from a memory.
- **Per-tab view memory** — list, board or calendar view stays where you left it.

Calendar & study scheduling — learning gets a real time slot.

- **Events and study sessions** live in one timeline alongside meetings.
- **ICS & Google import** so existing calendars sync in without manual entry.
- **Auto-suggest study blocks** against open windows in the day.
- **Linked to memories** — a study session opens straight into the source material.
- **Briefing-aware:** tomorrow's schedule appears in the morning email.

Flashcards & spaced repetition — retention without the busywork.

- **Auto-generated Q&A** from any memory, on demand — no manual deck building.
- **Spaced repetition scoring** tracks what you know, what you don't, and what to review.
- **Partial sessions count** — close a deck early and your score still lands.
- **Deep-link from a memory** straight into its deck via a single Smart Action.
- **Per-deck progress** visible in the dashboard study card.

“What property does multi-head attention preserve across token positions?”

Daily briefing & learning analytics — your morning, pre-thought.

- **Morning briefing email** at a time you choose, with weekend skip when you don't want it.
- **In-app briefing card** on the dashboard mirrors the email and stays fresh all day.
- **Streaks & learning velocity** show how much you captured, recalled and reviewed.
- **Domain radar** visualizes where your attention has actually gone this week.
- **Tomorrow's focus** surfaces what to act on first, generated from inbox + calendar.

Agent Hub — multi-agent chat with live streaming and a workflow trace.

- **Seven specialist agents** coordinated by an orchestrator: Capture, Recall, Plan, Briefing, Live, Library, Workspace.
- **Live SSE streaming** — tokens, tool calls and partial results arrive as they happen.
- **Workflow trace panel** shows which agent ran, what it called, and how long it took.
- **Codename masking** keeps internal agent identifiers out of user-facing copy.
- **Command palette** jumps from anywhere to the agent, with the inbox count surfaced inline.

Graph, Timeline & Workspace — three lenses on the same vault.

- **Knowledge Graph** — nodes are memories, edges are shared topics, people and projects.
- **Timeline** — every capture, task and event on one scrollable spine, by day.
- **Workspace** — a freeform canvas to assemble memories into a thesis, brief or doc.
- **Cross-linked** — clicking a node anywhere opens the same memory detail with full context.
- **Filter once, applies everywhere** — domain, source, project carry across views.

“Show me everything I read about pricing in the last 30 days.”

Inbox & review — one queue between input and action.

- **Waiting count** visible in the sidebar and command palette so the queue is never invisible.
- **Filters & full-inbox search** — find that one item from three weeks ago in seconds.
- **Bulk actions with undo** for triage at speed; reverse a confirm in one click.
- **Smart classification** routes items to read, watch, listen, or follow-up lanes.
- **Closes the loop** back into Tasks, Calendar and the next morning's briefing.

Recent enhancements shipped this cycle.

A focused round of polish across briefing, voice, inbox, mobile, safety and ergonomics — driven by what daily users hit most.

BRIEFING

Morning email + weekend skip

Briefing now arrives by email at your chosen time and quietly stays out of weekends unless you opt in.

VOICE

Voice mode polish

Cleaner “Checking Live availability” status, fewer keyboard / fan-noise false triggers.

INBOX

Bulk undo + full search

Triage faster with bulk actions, reverse mistakes in one click, and search across the entire inbox — not just the visible page.

MOBILE

Mobile layout improvements

Tighter vertical density, sticky action bars and better thumb reach across Capture, Tasks and Recall.

SAFETY

Vendor-name leak guards

Python copy checks plus a GitHub Actions guard keep internal vendor names out of user-facing strings.

ERGONOMICS

Per-tab view memory · agent codename masking · palette inbox count

Per-tab views remember themselves, agent codenames stay internal, and the command palette surfaces the inbox count where it matters.

Roadmap – the next three horizons.

NOW → 30 DAYS

Sharper daily loop

- › Briefing personalization per persona
- › Inbox keyboard shortcuts & saved views
- › Voice capture latency & transcript quality
- › Recall citations with inline highlighting

30 → 90 DAYS

Deeper knowledge work

- › Workspace canvas v2 with multi-memory blocks
- › Project-aware Agent Hub with shared context
- › Calendar two-way sync (Google & iCloud)
- › Flashcard scheduler with cohort spacing

90+ DAYS

Multi-brain & integrations

- › Team vaults with role-scoped recall
- › Public API for capture & recall
- › Browser extension for one-click capture
- › Mobile app — native capture & offline recall

How it's wired – three layers, streaming end to end.

READY WHEN YOU ARE

Try Recall X247

Capture once, recall anywhere, act on
what matters today. Your second brain
is fifteen minutes away.
